

TEAM ERISKAY

Production-focused 3D Artist with Technical Awareness

Iu Pak Hung Andy

TECHNICAL

What have I completed in past 12 weeks?

ASSET DESIGN WITH PROGRAMMING THINKING - DISTRACTION OBJECT (CUCKOO CLOCK)

- This is one of the 3D model for distraction event - cuckoo clock. The design is discussed by me and Euan. It has a horse head behind the barn door at the top area of the cuckoo clock, connected to the barn house with 2 pieces of plate (as the spring, texture not included, why plate? The idea is from Euan, by intimidating the past method of creating grass by layering different angles of texture to create spring, clever) ready to pop out anytime. A western shootout miniature at the bottom as an easter egg. Over-design cross bolt also for easter egg.
- As part of distraction event, it is designed to draw player's attention from the table. During the modeling, I have put visibility distance in the scene, its beautiful appearance, and the way it try to distract player into consideration. Make sure it is hilarious and always serving its designated functions.

ASSET DESIGN WITH PROGRAMMING THINKING - DISTRACTION OBJECT (TRAIN SET)

- This is one of the 3D model for distraction event - train set. Train set is designed in a modular way. Original concept from Euan contains only remote, track, steam engine and a basic platformer. I added a passenger car and tracks with different angles as DLC 1 and 2. It is modular as it is divided into several repeatable part, connected with magnets. In early design there are 2 at both end of each part but Aidan or Michael reminds me this is impossible to turn with 2 magnets, so they are reduced to 1.
- Materials and texture settings among both remote and train set are set to be similar or the same, to be treated as one complete toy set. The modular design allows further space for adjustment for level design.

ASSET DESIGN WITH PROGRAMMING THINKING - DISTRACTION OBJECT (TRAIN TRACKS AND DECORATION)

- Continuing from previous page, there are 5 different angles as different variations of tracks. They provides a huge varieties of closed tracks to be constructed by Advitiya.
- Looking at the design of train table and the mountain for decoration, I also designed them in discussion with Advitiya using 3ds max. The mountain is like only 10 seconds thing. The train table is what I am proud of, it is also one of the over-design 3D models. (They are EVERYWHERE HAHAAHAHA) The train table has 2 drawers as a functional parts of the table itself, to store the toy set. The design of drawer and handle is referenced from internet as to enhance realism. Edges of the table is leveled several time in different stable builds, to ensure it is not blocking the player vision to the track of train set. Because these auxiliary part are visually understated, still play a key guiding role in gameplay experience.

ASSET DESIGN WITH PROGRAMMING THINKING - DISTRACTION OBJECT (COCO MELON BABY)

- This is one of the 3D model for distraction event - coco melon baby. (objects not the baby himself) As shown in the images, it is separated in TV set with remote, cupboard underneath and a highchair for baby. It is a very good example to show the perfect collaboration of me and Euan.
- The design is strictly following Euan's concept art only added several detailing from me. The recesses on the cabinet doors that serve as handle, the dial of the TV which has a sphere shape grooves just like a real dial button, the splitting parts design of TV so that the projection of animation can be matched with adjustment in Unreal, the tips at the end of the antenna of TV that no one can see, the over-design stopper of the highchair, the bowl shape grooves on the table of highchair, and the 5 versions of remote with different buttons layout optimize for user experience. These are the design why they looks so realistic that player can always find elements from the game that can be connected to their memory, to achieve symphony.

ASSET DESIGN WITH PROGRAMMING THINKING - DISTRACTION OBJECT (FLY)

- This is one of the 3D model for distraction event - Fly and the fly swatter. It is almost the first textured object and the first completed set of 3D asset.
- Fly has a pair of glowing eyes in red. It is not a designated design but also one of my genius idea. In Unreal engine if the value of the color is set to a ridiculously large figures, it won't round up to 100% or 255. Instead, the material glows, bigger number causing even shinier color. (Totally a bug, because there is one another thing called emissive color in unreal texture) The rigging of flappy wings is fixed by Euan and works perfectly. The first time it shows up in the game has a 100 times bigger scale to original to try to scare the player, to test how everyone feels about the fly. I am proud they many people are being scared by it and that means it serve its designated purpose, as despicable and terrifying concept for distraction, usually annoying.

STORYTELLING (1)

In the world of GoodBabies, player character is sitting in front of the table to decide his fate. Bambino crime family, a group of mafia babies, seemingly innocent but dangerous. The buntings express the dangerous feeling. Designed by Advitiya. Deliberately using festive and childlike visual elements, to contrast with the nature of underground illegal activities, creating a threatening atmosphere. The flags are intentionally hung across the player's eye level, on top of bouncer. Spikey tips keeps reminding player this is a disguised crime scene.

The stuffy, tightly closed curtains and closed dark colored wooden door reinforce the player's impression of the criminal family and secret deals in the game. But I forgot to design a door frame.

STORYTELLING (2)

Chocolate gold coins, ice cream bowl and yellow rubber duck are all classical baby related items in daily life. In GoodBabies they are recontextualization as part of mafia culture. Chocolate gold coin represent the blood money circulating in between different crime families, repackaged as if it's harmless.

Ice cream bowl is for to enrich the characteristic of characters as babies love eating ice cream.

The yellow rubber duck serve a very important function, to be step by the bouncer to announce the suspicious raised by player is about halfway through the maximum value. It wasn't designed to be stepped on originally. I think Michael produces this clever idea as an audio notification to the player. The rubber duck soften the dangerous feeling from the scene.

STORYTELLING (3)

Part 3 of storytelling is about toys. Toys are separated into vehicles and cuddle toys in the concept art. There are forklift, dozer, eagle, giraffe, shark, and teddy bear.

The over-design again is very common among the toys. First there are dozer and forklift with flathead bolt and simple axle between wheels. The idea of adding bartender model as driver is inspired by Michael, he put different toys and coco melon baby inside the train set for driver and passengers.

The design of cuddle toys are very human. The eagle has rings of feather from chopped off of capsule shape. The beak is flipped from rubber duck with a bit modifying. The arms (or wings?) are popsicle, in original design they have no detail. I told Euan I am going to give them popsicles as arms then and he approved that. So, they have popsicles arm.

The giraffe is sitting with a cute position with the hind legs extending forward. The teddy bear is the teddy bear, if there anything you must know that will be its ears are made from donut.

The shark is one another 3D model I'm most proud of, it is bended from a modified capsule and a bunch of other parts. Pyramid shape for fins, ring + pyramid shape for tail. Most importantly it has ridiculous eyes putting too close together and it looks hilarious. It is actually an unintentional mistake I made as a joke. But everyone quickly adapt to this setting so now the shark will stare at player behind da don.

TECHNICAL CONSTRAINT AWARENESS

Before I take up the job as 3D artist for team Eriskay, I already mocked up the designated scale for referencing with a skeleton biped in 3ds max.

After the completion of Advitiya's level map, I exported it to 3ds max as the basic room for references. I matched the scale of character to objects, size of table and seats, object to interact with etc. I maintain a solely unified scale among every 3D elements. Before everything are constructed and placed correctly in the game, they were already tested by me in 3ds max and every time texturing of models happened.

The testimony of 3D assets taking place in both 3ds max and Unreal reduced error in scaling and most visual illusion issues. Taking example of TV remote, it looks nice in 3ds max but seemingly a bit off scale in Unreal and hence we modified the model with 5 versions to finally comes up with what we want.

Can't really said download and importing models from online resources is not a good method in games development, but self creating models with originality is one of the reason why our game is iconic.

PROCEDURAL

How do I focus on building workflows and processes that make my work predictable, transferable, and safe for others to build upon?

ASSET LIFECYCLE AWARENESS

I am creating models with iterative and modular design as the production goes on. The key element is the core part is separated so that they can be constructed repeatedly. Taking example of the snow fort in Tower Defense game, the core part is the igloo. It remains unchanged and I just match different top part to quickly produce different varieties for producer and level designer to pick. Such as numerous varieties of staircase in short period. Quick adjustments were only needed to be done to the surface for flexibility.

TASK TRACKING AND ASSET MANAGEMENT (1)

In the early stage of development we are not getting used to version control. Without proper naming rules, everything could be messy in file structure. For example, in the upper picture my 3D models were once constructed in Unreal blueprint and then summon in the game.

After setting up regulations among assets management and naming rules the issues are solved, below the train table model is imported as one and is clearer than before. It has lower down the risk anyone but me misuse or even overwrite the model. Everyone can allocate in file structure the model effectively.

TASK TRACKING AND ASSET MANAGEMENT

(2)

Continuing from previous page, we have a proper task tracker set up by Aidan and 3d assets list by Euan to manage our work efficiently. Through these tools we can quickly navigate the content and their priority, due date and current state. The description allows me to discuss with different roles according to the dependencies of specific set of asset to their work.

This aid the reliability of my work as I can response to different part of production effectively. Everyone can also expect outcomes from me and hence arrange their work.

86	13-Nov	Q&Q & Other balance Docs Alignment Polish Pass	Aidan	High	Done	ensure systems are working as intended and are accurately documented
87	30-Sep	Start to mess up around in new unreal scene(to be create tomorrow)	Andy	High	Done	To test how a fbx model transits between 3DS Max and Unreal Engine, also me
88	1-Oct	Character Controls Initial Implementation	Andy	High	Done	Different camera movement logic (Keyboard done/Mouse done) to be test and
89	2-Oct	Music Manager Component Initial Implementation	Andy	Medium	Done	add music manger component to communicate with game manager to imple
90	13-Oct	Modelling for baby monitor	Andy	High	Done	Need user review from Michael, but I guess it's alright
91	20-Oct	fly swatter model	Andy	High	Done	
92	29-Sep	Basic initial models for table and chairs (as the levelblockout map is being use now)	Andy	Medium	Done	Cutesy table and chairs.
93	20-Oct	Fly model	Andy	High	Done	
94	20-Oct	Create basic cuckoo clock model	Andy	Medium	Done	after fly swatter
95	24-Oct	Create TV set for cocomelon baby with remote for interaction	Andy	High	Done	
96	24-Oct	Create Train set as distraction event model	Andy	Low	Done	
97	27-Oct	Animate the cuckoo clock shooting scene	Andy	Medium	Done	
98	28-Oct	Cocomelon DE Related 3D Models	Andy	High	Done	Remote, TV, Child Safety Chair TM, cupboard
99	3-Jan	Make glass of milk from the concept art	Andy	Low	Done	it's funny no one found out this task is added 3-Jan-1900
100	3-Nov	Make the rubber duck from concept art	Andy	Low	Done	
101	27-Oct	Create environmental objects for storytelling	Andy	Medium	Done	SM_Env_MilkCartoon(done), SM_Env_MilkBottleGlass(done), SM_Env_MilkBo
102	13-Nov	Fix UV wrapping on wooden texture stuffs	Andy	Medium	Done	SM_Env_BarLight3(done), SM_Env_BabyRadio(done)
103	13-Nov	Create and edit drapes	Andy	Medium	Done	Fix UV wrapping
104	14-Nov	Environment Objects	Andy	Low	Done	edit the drapes from simulation to fit the baby playroom
105	17-Nov	Train Table Asset	Andy	Medium	Done	some tiny toys and other objects, nice to have, no rushing
106		Environment Objects	Andy	Low	Done	if any missing assets requested from Advitya - get them made

Category	Asset Name	Description	Priority	Assignee	Status	Notes
Interactive object	SM_Obj_FlyFly	Fly that flys around	High	Andy	Done	Lighter than many other assets
Interactive object	SM_Obj_FlySwatter	Tool to swat the flying fly	High	Andy	Done	Similar to ball, if a touch bigger
Interactive object	SM_Obj_CuckooClock	Constructive Event Clock in wall	High	Andy	Done	Disabable by PC, top part big enough to swat fly
Interactive object	SM_Obj_Televison	Constructive Event TV	High	Andy	Done	Big enough for clarity at distance
Interactive object	SM_Obj_TellRemote	TV remote for the television	High	Andy	Done	Quite large, possibly half the height of a standing baby
Interactive object	SM_Obj_TrainEngine	Plastic train car for the train set	High	Andy	Done	To be picked up by PC
Interactive object	SM_Obj_TrainCar1	Plastic train car for the train	High	Andy	Done	Big enough for clarity at distance
Interactive object	SM_Obj_TrainRemote	Small handheld controller	High	Andy	Done	Big enough for clarity at distance
Interactive object	SM_Obj_Duck	Duck that the toaster steps on	High	Andy	Done	To be picked up by PC
Interactive object	SM_Obj_Ball	Interactive balls	High	Andy	Done	Big enough for clarity at distance
Interactive object (Nice to have)	SM_Obj_MilkGlass	Glass Tumblers with milk and baby bottle head	High	Andy	Done	To be picked up by PC (Both Hands)
Interactive object (Nice to have)	SM_Obj_BarBell	Ball to order milk drink	High	Andy	Done	To be hit by the PC
Environmental object	SM_Env_Chair	Chair	High	Andy	Done	Concept to model from - Objects
Environmental object	SM_Env_Table	Table	High	Andy	Done	Concept to model from - Environment
Environmental object	SM_Env_HighChair	For cocomelon baby to sit in	High	Andy	Done	Concept to model from - Environment
Environmental object	SM_Env_Cupboard	Under the TV	High	Andy	Done	Concept to model from - Environment
Environmental object	SM_Env_Curtains	In front of window (Drapes)	High	Andy	Done	Concept to model from - Environment
Environmental object	SM_Env_CeilingLight	Above the center table	High	Andy	Done	Concept to model from - Environment
Environmental object	SM_Env_Bar	Left side of room, hosting bartender and clock	High	Andy	Done	Should extend to ceiling
Environmental object	SM_Env_Door	Right side with cabinet and the theme of the room	High	Andy	Done	It will be a small envious detail (Probably just the texture to model)
Environmental object (Nice to have)	SM_Env_Bunting	It will be hang above the door	High	Andy	Done	A bit wider than the width of a door
Environmental object (Nice to have)	SM_Env_Cradle	It will be set around the whole room	High	Andy	Done	A bit bigger than the size of a baby
Environmental object (Nice to have)	SM_Env_ChocolateCoin	It will be set around Da Don	High	Andy	Done	About the size to chew
Environmental object (Nice to have)	SM_Env_MilkCartoon	To be placed behind the bartender with massive amount	High	Andy	Done	Regular children size milk carton, probably 250ml
Environmental object (Nice to have)	SM_Env_GMIBottle	To be placed behind the bartender with massive amount	High	Andy	Done	Regular dairy milk glass for recycle
Environmental object (Nice to have)	SM_Env_PMIBottle	To be placed behind the bartender with massive amount	High	Andy	Done	Regular 2 L plastic milk bottle
Environmental object (Nice to have)	SM_Env_BarLight1	On top of the Bar table	High	Andy	Done	Concept to model from - Environment
Environmental object (Nice to have)	SM_Env_BarLight2	Above the bartender	High	Andy	Done	It's in my sketchbook roughly
Environmental object (Nice to have)	SM_Env_BarLight3	Above the bartender	High	Andy	Done	Fun stuff to have, about size of the head of a baby
Environmental object (Nice to have)	SM_Env_BabyRadio	On the left of the Bar table	High	Andy	Done	Fun stuff to have, about size of the head of a baby
Environmental object (Nice to have)	SM_Env_WineRack	To place milk product (You see baby doesn't know you have to keep milk in fridge)	High	Andy	Done	It's in my sketchbook roughly
Environmental object (Nice to have)	SM_Env_SmallTable	A small table to place a lamp	High	Andy	Done	It's in my sketchbook roughly
Environmental object (Nice to have)	SM_Env_Lamp	A lamp that is for lighting up the portrait	High	Andy	Done	Fun stuff to have, about size of the head of a baby
Environmental object (Nice to have)	SM_Env_Portrait	A portrait to fill up the space on the left of the bar table	High	Andy	Done	It's in my sketchbook roughly
Environmental object (Nice to have)	SM_Env_Poster	Posters to be placed 1 lots of places	High	Andy	Done	It's in my sketchbook roughly
Environmental object (Nice to have)	SM_Env_BabyRadio		High	Andy	Done	It's in my sketchbook roughly

COMMUNICATION AS PROCESS (1)

This page of notes from my sketchbook recorded my process of understanding the core gameplay from the programming perspective. I broke down the character controller, card game mechanism, and camera viewing logic using text and simple drawings, and then discussed with programmers about the design we need in blueprint to accomplish from concept.

I also have Advitiya to sketch a 2D game map as reference for visualizing the level design in early stage. I arranged priorities to create asset from the map.

COMMUNICATION AS PROCESS (2)

This page of notes from my sketches demonstrates how I use simple sketches and text to record early modelling ideas. Before formal modeling, I first use quick sketches to confirm the shape, proportions, and positioning of faces and edges, serving as visual guidelines for subsequent modeling.

I separate design in numerous parts and every time I only need to replicate 1 to 2 pieces from sketching.

This approach reduces the cost of repeated modifying and allows early-stage discussion, improving overall efficiency.

BEHAVIOURAL

What do I do to act responsibly and confidently within production?

SPEAKING UP EARLY

Through the 12 weeks of weekly reports, it shows that I tended to handle uncertainties independently, hoping to devise a complete solution before raising questions in the early stages of the project. While this approach stemmed from a sense of responsibility, it delayed the team's understanding of my issue and hence increased the risk of later bug fixing.

As the project progressed, I began to expose uncertainties in the weekly reports and raise estimations and questions in stand-up meetings and informal discussions. I informed the team with potential impacts before ideas were fully developed. Later reports showed that this immediate communication gradually became the norm, allowing problems to be corrected in the early stage.

PROFESSIONAL IDENTITY

During the project, I observed that other members intuitively understood and enjoyed the 3D assets I created in the production. This means that my work is readable both visually and functionally. This is a strong feedback that led me to establish a clearer professional identity: a 3D artist who can create 3D artists that are safe to use and fit seamlessly into the gaming experience. This identity is an important foundation for me to become a professional developer.
